10 October 2013
Renée Bruel

About the European Climate Foundation

The case for Energy Efficiency

Current EE policies and the 20% target for 2020

The case for an EE target in a 2030 Climate and Energy package

About the European Climate Foundation

The case for Energy Efficiency

Current EE policies and the 20% target for 2020

The case for an EE target in a 2030 Climate and Energy package

Mission

To promote climate and energy policies that greatly reduce Europe's greenhouse gas emissions and to help Europe play an even stronger international leadership role to mitigate climate change

What we do

We collaborate with grantees and experts from the field to design and fund strategies that support the adoption and implementation of climate and energy policies in Europe. Majority of funds are re-granted to NGOs. We also commission papers, convene stakeholders and build alliances among a wide range of partners in government, business and the NGO sectors.

Funding Partners

The William and Flora Hewlett Foundations, Children's Investment Fund Foundation, ClimateWorks Foundation, Stordalen Foundation, Arcadia Fund, McCall MacBain Foundation, Oak Foundation, Dutch Postcode Lottery
Plus various project funders

Where we operate: priority geographies

Where	Why
Brussels / EU	Influence EU legislative agenda (via European Commission and European Parliament)
Germany	Ensure EU Council leadership; Energiewende
UK	Rebuild EU Council leadership; Policy innovation potential
France	Ensure EU Council leadership; French Energy Transition Law
Poland	Prove a transition to a low-carbon economy by supporting effective implementation of EU directives into national policies and programmes
CEE network	Support effective implementation of EU directives via a transnational implementation support network
Spain	Prove sustainable economic recovery with alignment of effective implementation

-  Country programme: multi-programme priority with coordinated political strategy and budgets
-  Lighter engagement: EE programme only (and limited) investment

About the European Climate Foundation

The case for Energy Efficiency

Current EE policies and the 20% EE target for 2030

The case for an EE target in a 2030 Climate and Energy package

Challenges

- ✓ European economic stagnation
- ✓ High unemployment
- ✓ High fossil fuel import dependency
- ✓ Energy affordability
- ✓ Climate change
- ✓ Air and water pollution

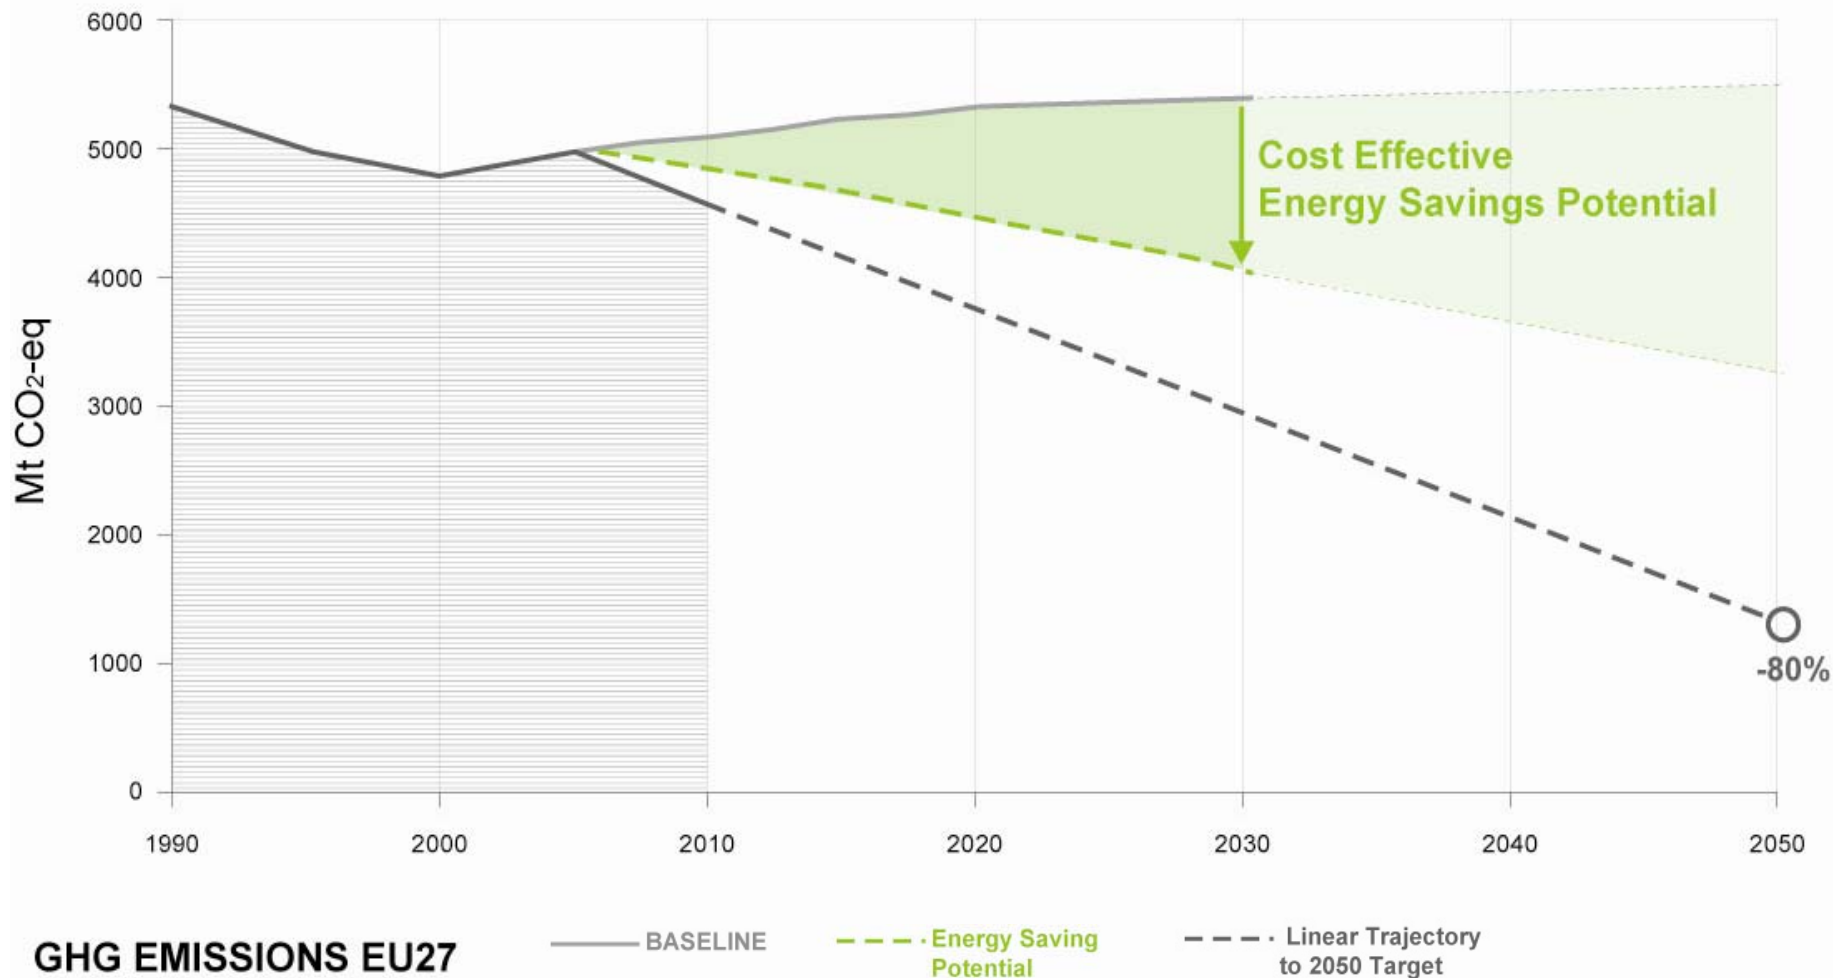

Opportunities

- ✓ Industrial productivity and competitiveness
- ✓ Macroeconomic benefits and jobs
- ✓ Reduce import dependency
- ✓ Energy provider and consumer benefits
- ✓ GHG emissions reduction
- ✓ Improved health & environmental quality

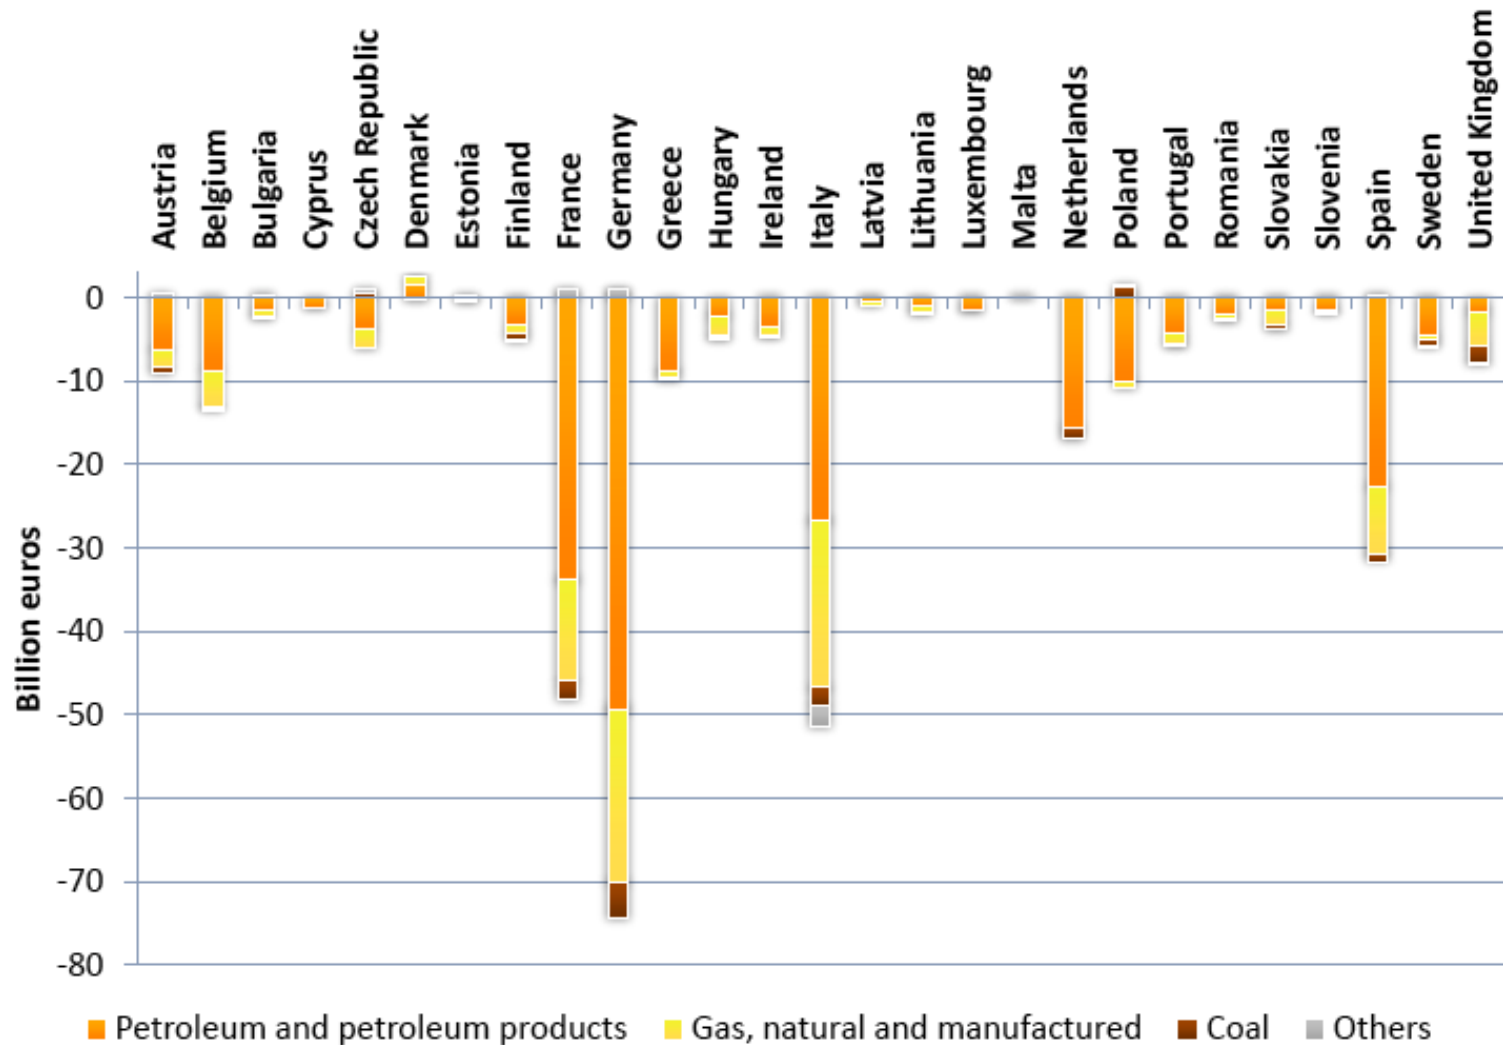

Europe's potential for energy efficiency

It is half the potential for achieving the EU's GHG emissions target

25 out of 27 EU member states are net oil & gas importers

Reducing Europe's dependency on imported fuels

WEO projects this situation to worsen by 2035

Net oil & gas import dependency in selected countries

EU energy prices will be nearly 3x China in 2035

Reducing energy bills

Average household electricity prices, 2035

- 2/3 of economic potential remains untapped in 2035

Europe must lead the way if it wants to

- Stay globally competitive
- Provide affordable energy to its citizens and industry
- Reduce GHG emissions

Key factors:

- Politics
- Implementation pathways

- Total net savings of reaching the 20% EE target by 2020 can be estimated at €200 billion annually
- Energy savings brings direct savings and indirectly reduces energy prices, by
 - Reduced demand has downward effect on fossil fuel prices
 - Electricity prices will be lower – merit order effect
 - Fewer investments in infrastructure needed

Ecofys 2012, Saving energy: bringing down Europe's energy prices for 2020 and beyond

About the European Climate Foundation

The Case for Energy Efficiency

Current EE policies and the 20% target for 2020

The case for an EE target in a 2030 Climate and Energy package

- 2020 Climate and Energy package: 3x20% target. EE non-binding target.
- Energy Efficiency Directive:
 - 1.5% annual binding savings target
 - national building renovation roadmaps
 - 3% of national public buildings to be renovated energy efficiently each year
- Energy Performance of Buildings Directive:
 - By 2020, new buildings have to be 'nearly zero energy buildings'
 - Other measures to improve energy efficiency of buildings

- Ecodesign and Labelling directive
 - Minimum efficiency standards for appliances (household and commercial)
 - Energy label for appliances
- Car standards 95gr/CO₂ per km
 - Brings more than 500,000 additional jobs in 2030
 - Saves the owner of a new car around € 300-400 annually
 - Reduces import dependency on oil
 - Reduces CO₂-emissions

Still, we will not achieve 20% savings by 2020

**Primary energy savings gap of
68 Mtoe**

2009 policy outlook

*20% Savings Target
1474 Mtoe*

Primary energy consumption in 2020

About the European Climate Foundation

The Case for Energy Efficiency

Current EE policies and the 20% target for 2020

The case for an EE target in a 2030 Climate and Energy package

Principles of a new policy package for 2030

- EU global leader in transition to low-carbon economy
- Targets to be in line with 95% GHG-emission reduction by 2050
- A framework that integrates climate change needs, energy affordability, security of supply and competitiveness concerns
- Coherent set of targets

- Cost-effective energy saving potentials until 2030 can be found in
 - transport (41%)
 - households (61%)
 - tertiary sector (38%)
 - industry (26%)

(Fraunhofer, 2009, 2012)

A target of 41% is feasible

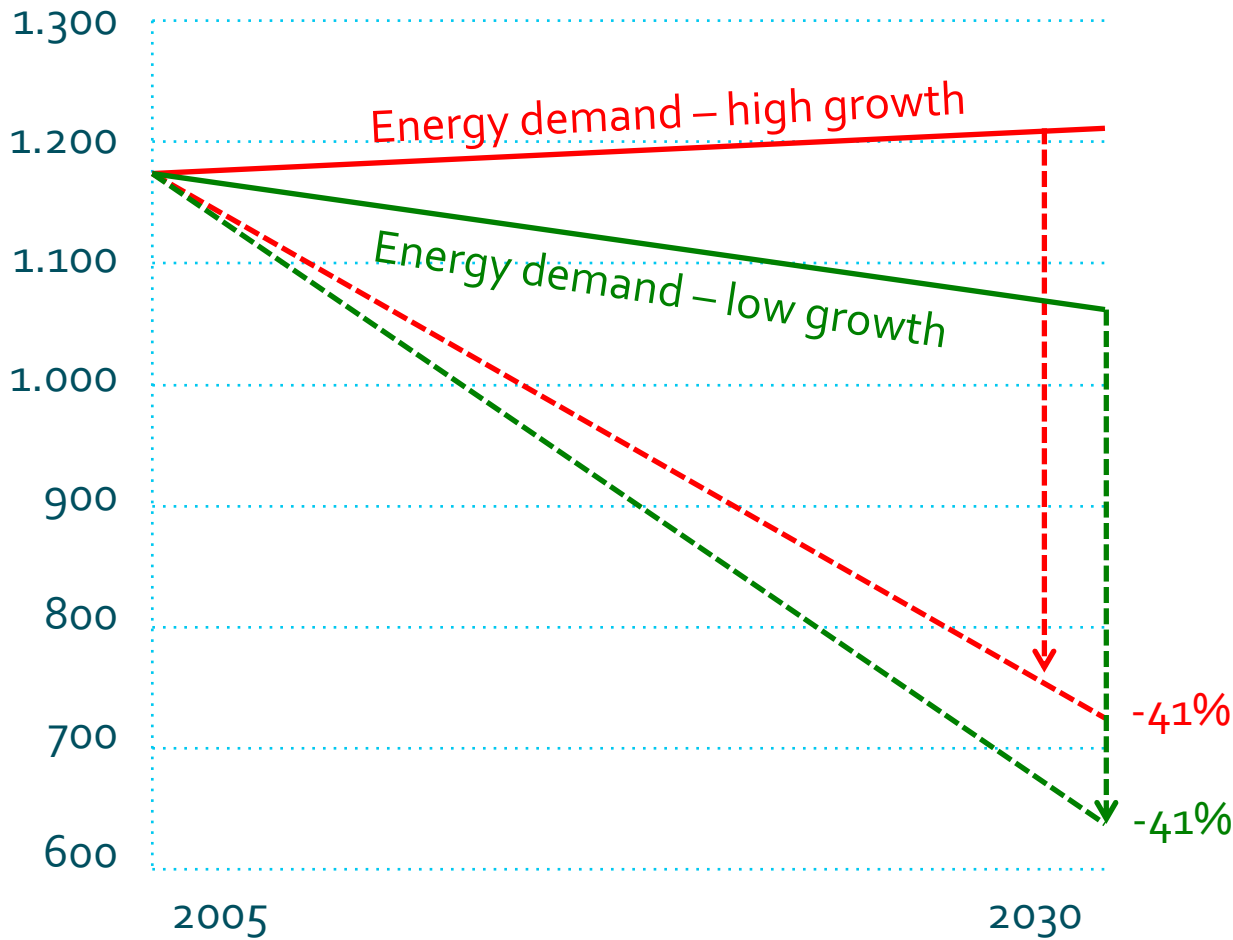

- 40% binding end-use energy savings target for 2030 is what the Coalition for Energy Savings asks for

Energy and Climate Policy package for 2030 needs a binding target for Energy Efficiency:

- Policy focus needed
- Implementation of policy
- Long term certainty for investors
- Energy Efficiency is not sufficiently driven by climate policies alone

- A binding end-use energy savings target of 40% for 2030
- Combined with high growth and 35% renewable energy or low growth and 48% renewable energy share
- Results in 49 to 61% greenhouse gas emission reductions compared to 1990 levels

EU final energy consumption in Mtoe

35%
RES

49%

GHG
emission
reduction

48%
RES

61%

How does a GHG target only relate to energy efficiency?

- Reducing GHG emissions by 40% compared to 1990 levels, and
 - High or low growth and 28% RE share
- Requires no savings or a maximum of 25% energy savings

EU final energy consumption in Mtoe

- Study by Prognos and IAEW Aachen: quantitative assessment of economic benefits of energy efficiency on the total system costs of the electrical system
- Preliminary results: ambitious energy efficiency can reduce the costs of the transformation of the power sector with several billion euros annually
- Study will be published in about a month

- Ambitious energy efficiency policies bring large benefits for Europe
- The potential for EE will not be realised without strong EE policies
- To unlock the EE potential until 2030, we need a binding target, and
- A binding EE target and RES target will lead to considerable GHG emission reduction, but
- A GHG emission reduction target will not unlock the EE potential

Thank you for your attention!
